Gamet Bearings

THE COMPANY

Gamet Bearings have been manufacturing high precision tapered roller bearings for over forty years in their Colchester factory.

Originally founded to serve the machine tool industry, Gamet has today expanded into other sectors of industry having high precision bearing requirements. These include the coating of materials, photographic emulsions or adhesives, and the printing and packaging industries. Ongoing investment in new equipment and technology will ensure the continuing reputation of Gamet as a manufacturer of high precision, high quality bearings.

THE COMPANY
DIE FIRMA
LA SOCIÉTÉ

DIE FIRMA

Gamet Bearings produziert seit über vierzig Jahren Präzisionskegelrollenlager in den Fertigungsstätten in Colchester.

Die Firma war ursprünglich gegründet worden, um die Werkzeugmaschinenindustrie zu versorgen. Der Wirkungskreis wurde bis heute jedoch auch auf andere Industriezweige wie z.B. die Beschichtungsindustrie, Hersteller von photographischen Emulsionen und Klebstoffen, das Druckgewerbe und die Verpackungsindustrie ausgedehnt.

Durch laufende Investitionen in neuen Maschinen und Technologie wird sichergestellt, daß unser guter Ruf als Hersteller von hochwertigen Präzisionslagern auch weiterhin gefestigt ist.

LA SOCIÉTÉ

Depuis plus de quarante ans Gamet Bearings fabrique des roulements à rouleaux coniques de haute précision dans son usine de Colchester. Crée à l'origine pour servir l'industrie de la machine-outil, Gamet a diversifié ses activités dans d'autres secteurs industriels utilisant des roulements de haute précision comme par exemple le revêtement des matériaux, les adhésifs et l'industrie de l'imprimerie et de l'emballage.

La poursuite d'investissements dans de nouveaux équipements et des nouvelles technologies assurera la réputation continue de Gamet en tant que fabricant de roulements de haute qualité et de précision.

Certificate No. EMI1893
BS EN ISO 9002 : 1994

INFORMATIONS SUR LA PRÉPARATION ET LE MONTAGE

Gamet Bearings

PREPARATION AND MOUNTING INFORMATION

After inspection Gamet's bearings are treated with a corrosion preventative oil, (except pre-greased bearings). Initial packaging is heavy gauge PVC bags, which are heat sealed, and boxed. Bearings can be stored for long periods providing packaging is not damaged and the storage area is dry and not subject to extremes of temperature.

Mounting should be undertaken in clean, dry, dust free conditions away from metal working or other operations producing swarf or dust.

It is recommended that drawings and instructions are studied to determine the correct order of assembly. All necessary parts, tools and equipment should be available before commencing.

Each component of the spindle arrangement (housing, shaft etc.) must be carefully cleaned and checked for burrs. Dimensional and form accuracy of all components in contact with the bearings should be checked as optimum bearing performance can only be achieved if the prescribed tolerances are adhered to.

Bearings should remain in the original packaging for as long as possible prior to fitting to prevent the risk of contamination.

Whenever possible, bearings should be mounted onto the shaft in vertical position. It is very important that the correct method of mounting is chosen and that suitable equipment is used.

The inner races (cones) of the bearings must be pre-heated to expand sufficiently to assist mounting on shaft. Never attempt to fit cold as the amount of interference between cones and shaft will prevent sliding and any direct blows will cause damage to rolling elements and raceways. Heating can be achieved using induction heaters, ideal for grease lubricated bearings, or oil baths suitable for oil lubricated bearings. Under no circumstances should a pre-greased bearing be heated by submerging in oil as contamination of grease will occur. The temperature required to sufficiently expand cones to allow reasonable mounting time varies depending upon size and section, but 70°C will suffice for the majority of applications. Care must be taken when locking bearings to ensure all rolling elements are seated properly, this is achieved by rotating at periodic intervals during locking. For specific advice contact Gamet Bearings.

INFORMATIONEN ÜBER DIE VORBEREITUNG & MONTAGE

Mit Ausnahme der vorgeschriften Lager werden Gamet-Lager nach der Inspektion mit einem Korrosionsschutzöl behandelt und in starken, heißverriegelten PVC-Beuteln und Kartons verpackt. Wenn die Verpackung nicht beschädigt worden ist, der Lagerraum trocken ist und keine extremen Temperaturen vorherrschen, dann können die Lager über lange Zeiträume aufbewahrt werden.

Die Lager sollten unter sauberen, trockenen, staubfreien Bedingungen und nicht in der Nähe von Metallverarbeitung bzw. anderen Arbeiten, wo Späne bzw. Staub anfallen, montiert werden.

Wir empfehlen die gründliche Einsicht der Zeichnungen und Instruktionen, damit Sie die korrekte Reihenfolge der Montage festlegen können. Vor Arbeitsbeginn sollten alle notwendigen Teile, Werkzeuge und Geräte vorhanden sein.

Jedes Teil der Wellengruppe (Gelenke, Welle usw.) muß gründlich gereinigt und wegen Graten untersucht werden. Die Genauigkeit der Maße und Form aller Teile im Kontakt mit dem Lager sollte geprüft werden, weil ihre optimale Leistung nur möglich ist, wenn die vorgeschriebenen Toleranzen eingehalten werden.

Vor der Montage sollten die Lager so lange wie möglich in der Originalverpackung gelassen werden, um die Gefahr von Verschmutzung zu verhindern.

Wo immer möglich sollten die Lager vertikal auf der Welle montiert werden. Es ist sehr wichtig, daß das korrekte Montageverfahren gewählt wird und geeignete Werkzeuge benutzt werden.

Die Innenlaufbahn (Kegel) der Lager muß vorher erwärmt werden, damit sie sich ausreichend ausdehnt, um die Montage auf der Welle zu erleichtern. Niemals kalt montieren, weil das Ausmaß an Widerstand zwischen den Kegeln und der Welle Gleiten behindert, und alle direkten Schläge verursachen Beschädigung der rollenden Elemente und Laufbahnen. Die Lager können im Induktionsofen erwärmt werden - ideal für fettgeschmierte Lager - bzw. im Ölbad bei ölgeschmierten Lagern. Vorgeschrifte Lager dürfen unter keinen Umständen durch Eintauchen im Öl erwärmt werden, weil das Schmierfett verunreinigt wird. Die für das adäquate Ausdehnen der Kegel notwendige Temperatur, um eine angemessene Montagezeit zu ermöglichen, wird von der Größe und dem Querschnitt bedingt, aber 70°C reichen in den meisten Anwendungen aus. Beim Einrasten der Lager muß man aufpassen und sicherstellen, daß alle rollenden Elemente korrekt eingesetzt werden, dies ist möglich, wenn beim Einrasten regelmäßig gedreht wird. Für weitere Empfehlungen bitte Gamet Bearings um Rat fragen.

INFORMATIONS SUR LA PRÉPARATION ET LE MONTAGE

Après inspection, les roulements Gamet sont malisés avec une huile anti-corrosion (à l'exception des roulements pré-graissés). L'emballage initial est en PVC de gros calibre, fermé hermétiquement, puis mis en boîtes. Les roulements peuvent être conservés pendant de longues périodes à condition que l'emballage ne soit pas endommagé et que l'endroit où ils se trouvent soit sec et ne soit pas soumis à des températures extrêmes.

Le montage doit avoir lieu dans un environnement propre, sec sans poussière, à l'écart de tout atelier traçant les métaux ou produisant de fins copeaux ou de la poussière.

Il est recommandé d'étudier les plans et les instructions pour déterminer l'ordre d'assemblage. Procurez-vous tout le matériel, les outils et les pièces nécessaires avant de commencer.

Il faut nettoyer soigneusement chacun des composants de la broche (logement, arbre, etc.) et s'assurer qu'ils ne présentent aucune ébarbure. Il faut vérifier la précision des dimensions et de la forme de toutes les pièces en contact avec les roulements car leur performance optimale ne peut être atteinte que si les tolérances prescrites sont respectées.

Les roulements doivent rester dans leur emballage d'origine jusqu'à ce qu'ils soient prêts à être installés pour éviter tout risque de contamination.

Dans la mesure du possible, les roulements doivent être montés sur l'arbre en position verticale. Il est très important d'utiliser la bonne méthode de montage et d'utiliser un matériel approprié.

Les bagues intérieures des roulements (idues) des roulements doivent être pré-chauffées pour les dilater suffisamment et faciliter ainsi le montage sur l'arbre. Ne jamais tenter de monter l'élément à froid car l'interférence entre les cônes et l'arbre empêcherait le glissement de la pièce et tout impact direct endommagerait les éléments roulants et les gorges. Le réchauffement peut être obtenu à l'aide d'un chauffage à induction, idéal pour les roulements lubrifiés à la graisse, ou à l'aide de bains d'huile pour les roulements lubrifiés à l'huile. Un roulement pré-graissé ne doit en aucune circonstance être chauffé en l'immergant dans de l'huile car cela entraînerait la contamination de la graisse. La température nécessaire pour dilater suffisamment les cônes afin de vous laisser assez de temps pour le montage varie suivant la taille et la section, mais 70°C est suffisant dans la majorité des applications. Il faut prendre le plus grand soin lors du serrage des roulements pour être sûr que tous les éléments roulants sont bien en place; cela est assuré en exigeant une rotation à intervalles réguliers durant le serrage. Pour tout conseil spécifique, veuillez contacter Gamet Bearings.

INFORMATIONS SUR LA PRÉPARATION ET LE MONTAGE

PREPARATION AND MOUNTING INFORMATION
INFORMATIONEN ÜBER DIE VORBEREITUNG & MONTAGE
INFORMATIONS SUR LA PRÉPARATION ET LE MONTAGE

LUBRICATION

Bearings must be correctly lubricated to reduce friction between the rolling elements and raceways. Lubrication will minimize wear and protect bearing surfaces against corrosion. The choice of a suitable lubricant and method of lubrication is very important and depends upon the operating conditions (temperature, range, speeds, loads, environment). A wide variety of greases and oils is available offering solutions for all applications.

OIL

Oil lubrication is normally used where higher operating speeds are required as this offers more efficient heat dissipation.

The selection of a suitable viscosity grade is important to optimise the life and performance of bearings and adjacent components.

Filtration is strongly recommended as contaminated oil will have an adverse effect on bearing life and performance.

Regular inspection of oil and filters is advised and changes made when necessary.

Catalogue speed ratings are based on the use of oil lubrication.

GREASE

Grease lubrication offers a simplified and cost effective option as the lubricant is more easily retained within the bearing. It also eliminates the need for complicated and costly lubrication delivery and drainage systems.

Sealing of the bearings is important to eliminate the possibility of contaminant ingress and to retain the grease within the bearing structure.

Bearing speed ratings may reduce with grease lubrication. If you plan to use greased bearings, advice on maximum speeds can be obtained from Gamet's engineering department.

Gamet Bearings offers a service of supplying bearings pre-greased to suit your requirements.

RUNNING-IN

After installation bearings require a running-in phase to condition and match mating surfaces, this will ensure optimum performance. This is more critical when using grease lubrication as sufficient time is required to disperse and evenly distribute the lubricant within the bearing. If this is neglected, temperatures can rise rapidly causing localised overheating and lubricant break-down which can lead to premature bearing failure or inferior spindle performance.

Gamet Bearings offer advice relating to specific applications.

SCHMIERUNG

Lager müssen korrekt geschmiert werden, um Reibung zwischen den rollenden Elementen und Laufbahnen zu reduzieren. Schmierung minimiert Verschleiß und schützt die Lagerflächen vor Korrosion. Die Wahl eines geeigneten Schmiermittels und Schmierverfahrens ist sehr wichtig und wird von den Betriebsbedingungen (Temperaturbereich, Drehzahl, Belastung, Umfeld) bedingt. Viele verschiedene Fett- und Ölsorten sind erhältlich, die Lösungen für alle Anwendungen bieten.

ÖL

Bei höherer Betriebsdrehzahl wird normalerweise mit Öl geschmiert, weil das die Wärme effizienter ableitet. Die Wahl einer Sorte mit geeigneter Viskosität ist wichtig, um die Lebensdauer und Leistung der Lager und benachbarten Teile zu optimieren.

Filtrieren wird ausdrücklich empfohlen, weil schmutziges Öl die Lebensdauer und Leistung der Lager beeinträchtigt.

Wir empfehlen die regelmäßige Inspektion des Öls und der Filter, die ggf. gewechselt werden müssen.

Die Drehzahleinstufungen im Prospekt sind auf die Verwendung von Ölschmierung gestützt.

SCHMIERFETT

Fetschmierung ist eine vereinfachte und kostenrentable Option, weil das Schmiermittel leichter im Lager zurückgehalten wird. Das eliminiert auch die Notwendigkeit von komplizierten und teuren Schmier- und Ablaufsystemen.

Das Abdichten der Lager ist wichtig, denn es eliminiert das mögliche Eindringen von Schmutz und hält das Schmierfett im Lagergefüge zurück.

Fetschmierung kann die Lagerdrehzahleinstufung mindern. Wenn Sie die Verwendung geschmierter Lager beabsichtigen, dann gibt die technische Gamet-Abteilung gerne Rat für die Höchstdrehzahl.

Gamet Bearings liefert vorgeschmierte Lager, die Ihren Anforderungen angepasst sind.

EINFAHREN

Nach der Montage müssen die Lager eingefahren werden, um die Paßflächen zu konditionieren und anzupassen, dies gewährleistet optimale Leistung. Bei Fetschmierung ist das kritischer, weil genug Zeit gebraucht wird, bis sich das Fett gleichmäßig im Lager verteilt hat. Wenn dies unterlassen wird, können die Temperaturen schnell steigen und lokalisierte Überhitzung sowie Schmiermittelzerersetzung verursachen, die zum vorzeitigen Lagerausfall bzw. minderwertiger Wellenleistung führen können.

Gamet Bearings gibt Rat für besondere Anwendungen.

LUBRIFICATION

Les roulements doivent être correctement lubrifiés afin de réduire les frottements entre les éléments roulants et les chemins de roulement. La lubrification a pour rôle de minimiser l'usure et de protéger les surfaces des roulements contre la corrosion. Le choix du lubrifiant et la méthode de lubrification sont très importants et dépendent des conditions de fonctionnement (température, charges, vitesses, environnement). Un grand nombre de graisses et d'huiles sont disponibles, offrant une solution pour chaque application.

HUILE

La lubrification à l'huile est en général utilisée pour des applications exigeant des vitesses plus élevées car la chaleur se dissipe plus efficacement.

Le choix d'indice de viscosité correct est important pour optimiser la longévité et les performances des roulements et des pièces adjacentes.

Un système de filtration est fortement recommandé car une huile contaminée aurait un effet défavorable sur la longévité et les performances des roulements.

Nous recommandons d'inspecter régulièrement l'huile et les filtres et de les remplacer lorsque nécessaire.

Les vitesses de base du catalogue sont données pour la lubrification à l'huile.

GRAISSE

La graisse lubrifiante offre une option simplifiée et rentable car le lubrifiant est plus facilement retenu au sein des roulements. Ceci élimine parallèlement les besoins compliqués et coûteux des systèmes de distribution et de vidange.

L'étanchéité des roulements est importante pour éliminer toute possibilité de pénétration d'impuretés et pour retenir la graisse au sein de la structure des roulements.

Une lubrification à la graisse peut entraîner une réduction des vitesses de base. Si vous avez l'intention d'utiliser des roulements graissés, vous pouvez obtenir des conseils sur les vitesses maximum auprès du Service Technique de Gamet.

Gamet Bearings est en mesure de fournir des roulements pré-graissés adaptés à vos besoins.

RODAGE

Après installation, les roulements nécessitent une période de rodage pour conditionner les surfaces, assurant ainsi une performance optimale. Cette étape est plus critique dans le cas de lubrification à la graisse car cela demande plus de temps pour disperser et distribuer uniformément le lubrifiant dans le roulement. Si cette opération est négligée, les températures peuvent s'élever rapidement, entraînant une surchauffe localisée et la rupture du lubrifiant, ce qui conduirait à une défaillance prémature du roulement ou des performances inférieures de la broche.

Gamet Bearings demeure à votre disposition pour tout conseil concernant des applications spécifiques.

Gamet Bearings

SPECIALS

Gamet Bearings are available in the following Precision Grades:

| Grade | Radial Runout (Cone Bore) | Prefix to Part No. |
|----------|------------------------------|--------------------|
| Standard | 0,0015mm | Noise |
| 'Q' | 0,0010mm | 'Q' |
| 'QK' | 0,0005mm | 'QK' |

Higher specification grades offer improved radial run-outs and component roundness.

Gamet Bearings also offer a comprehensive service for the design and manufacture of other Tapered Roller Bearings to suit specific requirements. We will be pleased to offer our experience and technical expertise in assisting you to achieve the best possible results and maximise cost effectiveness, for all non-standard applications.

SPEZIALLAGER

Die Präzisionslager von Gamet Bearings sind in den folgenden Güten erhältlich:

| Güte | Radialschlag (Kegelbohrung) | Präfix zur Teile-Nr. |
|----------|--------------------------------|----------------------|
| Standard | 0,0015mm | keine |
| 'Q' | 0,0010mm | 'Q' |
| 'QK' | 0,0005mm | 'QK' |

Güten höherer Spezifikation bieten verbesserten Radialschlag und Bauteilrundheit.

Entsprechend Ihrer besonderen Anforderungen bietet Gamet Bearings auch einen universellen Service für die Konstruktion und Fertigung anderer konischer Rollenlager. Wir offerieren gerne unsere Erfahrung und technische Expertise, damit Sie die bestmöglichen Resultate erzielen und maximale Kostenrentabilität bei allen ungewöhnlichen Anwendungen haben.

ROULEMENTS SPÉCIAUX

Les roulements de Gamet Bearings sont disponibles dans les qualités de précision suivantes:

| Qualité | Precision Radiale (Calibre du Cone) | Prefixe du No de la Piece |
|----------|--|---------------------------|
| Standard | 0,0015 mm | Aucun |
| "Q" | 0,0010 mm | "Q" |
| "QK" | 0,0005 mm | "QK" |

Des qualités supérieures offrent des précisions radiales améliorées et un meilleur arrondi de la pièce.

Gamet Bearings offre également un service complet concernant l'étude et la fabrication d'autres roulements à rouleaux coniques adaptés à vos besoins spécifiques. Notre expérience et notre expertise technique sont à votre disposition pour vous aider à obtenir les meilleurs résultats possibles et maximiser le rapport coût-efficacité de toutes les applications hors normes.

ROULEMENTS SPÉCIAUX

Gamet Bearings

COMPONENT PARTS OF A GAMET TAPERED ROLLER BEARING

Gamet bearings consist of four basic components – the inner race (cone), the outer race (cup), tapered rollers and cage. The cone, rollers and cage form an assembly which is separable from the cup.

BESTANDTEILE EINES GAMET KEGELROLLENLAGERS

Gamet Lager bestehen aus vier Bauteilen. Dem Innenring, dem Außenring, den Kegelrollen und dem Käfig. Innenring, Rollen und Käfig bilden eine Baugruppe, die vom Außenring getrennt werden kann.

CONSTITUANTS D'UN ROULEMENT À ROULEAUX CONIQUES GAMET

Les roulements se composent de quatre éléments fondamentaux. La bague intérieure (ilme), la bague extérieure (cavette), les rouleaux et la cage.

Le rôle, les rouleaux et la cage forment un ensemble qui est séparable de la cavette.

PRINCIPLES OF GAMET TAPERED ROLLER BEARINGS

The geometry of tapered roller bearings provides certain unique features: most importantly, the long line contact between roller and race gives high load carrying capacity and high bearing stiffness. The 'on apex' design ensures a true rolling motion of the rollers on the raceways, at every point along the roller body. See Fig. 1. In addition, the tapered construction allows the bearing to carry combinations of radial and thrust load. The small seating force (x) produced at the rib aligns the rollers to prevent skewing. See Fig. 2.

PRINZIP DER GAMET KEGELROLLENLAGER

Die Geometrie von Kegelrollenlagern hat gewisse einmalige Merkmale. Das wichtigste Merkmal ist dabei die lange Kontaktfläche zwischen den Rollen und den Lagerschalen, die eine hohe Belastungskapazität und große Lagersteifigkeit erzielen. Durch die besondere Anordnung treffen die Verlängerungen der Lauflächen der kegeligen Rollen an einem Punkt zusammen (siehe Bild 1). Hinzu kommt noch, daß, durch die Konstruktionsweise der Kegel bedingt, die Lager sowohl axial als auch radial belastet werden können. Die geringe resultierende Kraft 'x' am Bund führt die Rollen und gewährleistet einen genauen Abrollvorgang der Rollenkörper an jedem Punkt der Laufbahnen (siehe Bild 2).

PRINCIPE DES ROULEMENTS À ROULEMENTS CONIQUES GAMET

La géométrie des roulements à rouleaux coniques présente certaines particularités uniques. La plus importante est la longue ligne de contact entre le rouleau et la piste du roulement qui permet de supporter de fortes charges et est caractérisée par une grande rigidité du roulement. Une conception 'au sommet' assure un mouvement de rotation rigoureux des rouleaux sur les pistes, à chaque point de la génératrice des rouleaux. Fig. 1. De plus, sa construction unique permet au roulement de supporter des charges tant radiales qu'axiales.

La faible force résultante (x) sur la colerette d'appui aligne les rouleaux et empêche leur mise de travers. Fig. 2.

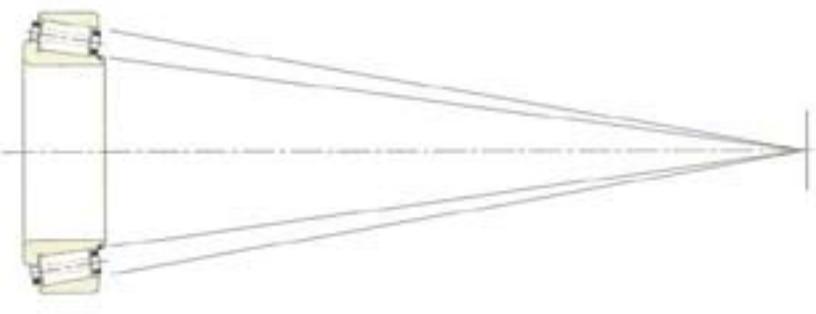

Fig 1

On-apex design results in true rolling motion at all points along the roller body.

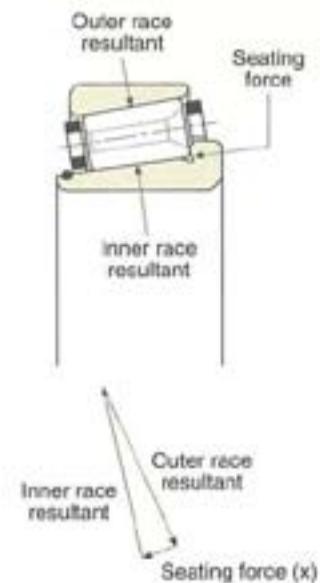

Fig 2

Small seating force from the inner race rib keeps rollers aligned on the raceway.

OTHER SPECIFIC FEATURES OF GAMET TAPERED ROLLER BEARINGS INCLUDE:-

Precision – Gamet bearings are manufactured only in a high precision class (see page 5).

Hollow Rollers – This assists the flow of lubricant through the bearing to provide cooling.

Roller Roundness and Calibration – A true roundness of rollers ensures equal load sharing within the bearing and contributes significantly to the overall precision of the bearings. Gamet Rollers are ground between centres to achieve near perfect roundness. Centreless grinding cannot achieve this degree of precision. Rollers are then calibrated precisely into matched sets.

Bearing Cage – The cage has a low coefficient of friction. It is guided on the inner race to provide radial stability and is designed to pass sufficient oil across the races to maintain lubrication, the remainder being diverted through the centre of the roller. Depending on rotational speed, grease lubrication may be used as an alternative to oil.

WEITERE BESONDERE EIGENSCHAFTEN DER GAMET KEGELROLLENLAGER:

Präzision – Gamet Lager werden nur als Präzisionslager geliefert (siehe Seite 5). Hohle Rollen ermöglichen, daß das Schmiermittel durch das Lager fließen kann, um es zu kühlen. *Rundheit und Eichung der Rollen* – Eine genaue Rundheit der Rollen ermöglicht eine gleichmäßige Lastverteilung im Lager und trägt somit erheblich zur Genauigkeit des Lagers bei. Gamet Rollen werden zwischen Zentriertspitzen geschliffen, um eine nahezu perfekte Rundheit zu erzielen. Danach werden die Rollen dann paarweise genau gecheckt. *Lagerkäfig* – Dieser besitzt einen niedrigen Reibungskoeffizienten. Er wird auf der inneren Lagerschale geführt, um radiale Stabilität zu erzielen und ist so konzipiert, daß genügend Öl über die Lagerschalen fließen kann, um eine gute Schmierung zu gewährleisten. Das restliche Schmiermittel wird durch die Rollen geleitet. Abhängig von der Drehzahl kann Fett als Alternative zur Ölschmierung verwendet werden.

LA PRÉCISION EST UNE AUTRE CARACTÉRISTIQUE SPÉCIFIQUE AUX ROULEMENTS À ROULEAUX CONIQUES GAMET.

Les roulements Gamet sont fabriqués uniquement dans une catégorie de haute précision (cf. page 5). *Roulements creux* – Ils facilitent le débit du lubrifiant à travers les roulements pour le refroidissement. *Roulements bombés et calibrés* – Des roulements légèrement bombés permettent une répartition égale de la charge dans le roulement et améliorent sensiblement la précision générale des roulements. *Les roulements Gamet* sont rectifiés entre pointes pour obtenir une circularité presque parfaite. La rectification sans centre ne peut obtenir ce degré de précision. *Les roulements* sont alors soigneusement calibrés en jeux assortis. *Cage du roulement* – La cage a un faible coefficient de friction. Elle est guidée sur la bague intérieure du roulement pour obtenir la stabilité radiale et est conçue afin de répartir suffisamment d'huile sur les chemins de roulement pour maintenir la lubrification, l'excédent étant dévié à travers le centre du roulement. En fonction de la vitesse de rotation, la lubrification peut se faire avec de la graisse à la place d'huile.

Gamet Bearings

The basic single row bearing can be used in light to medium loaded applications, and provides a simple, cost-effective arrangement.

Das einreihige Standard-Lager kann für leichte bis mittelschwere Anwendungen eingesetzt werden und ermöglicht eine einfache, kostengünstige Lösung.

Le roulement à une rangée peut être utilisé pour les applications avec charge légère ou moyenne et permet un montage simple et économique. Ils sont utilisés par paires en opposition et préchargés avec un écrou ou une rondelle s'appuyant sur la bague intérieure.

BENEFITS

- Designed and manufactured in the UK by one of the world's leading Precision Bearings companies
- Cone Bore Run-out tolerances ranging from 0.5 microns to 1.5 microns
- Comprehensive range of sizes from 25mm bore upwards
- Quality assured to ISO 9000 standards
- High quality bearing materials
- Specialist design and manufacturing service available to meet your particular requirements
- Competitive delivery on most sizes

VORTEILE

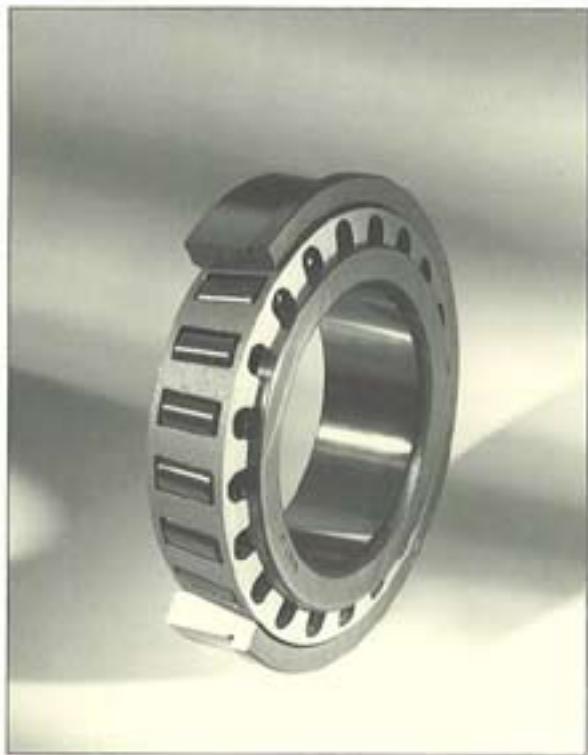

- In Großbritannien von einem der weltweit führenden Hersteller von Präzisionslagern konstruiert und gefertigt
- Kegelbohrung-Schlagtoleranz von 0,5 My bis 1,5 My
- Breites Angebot an Größen mit einer Bohrung ab 25mm
- Qualität nach den ISO 9000 Normen gewährleistet
- Werkstoffe höchster Qualität für die Lager
- Ihren besonderen Anforderungen entsprechend fachmännischer Konstruktions- und Fertigungsservice
- Konkurrenzfähige Lieferfristen für die meisten Größen

AVANTAGES

- Conçus et fabriqués en Grande-Bretagne par un des leaders mondiaux dans le domaine des roulements de précision
- Tolérance du calibrage du côté se situant entre 0,5 et 1,5 microns
- Un choix complet de tailles à partir de 25 mm d'alésage
- Qualité conforme aux normes ISO 9000
- Roulements en matériaux de haute qualité
- Un service d'étude et de fabrication spécialisé à votre disposition pour répondre à vos besoins particuliers
- Livraison devant la concurrence pour la plupart des tailles.

- Werkstoffe höchster Qualität für die Lager

AVANTAGES

- Conçus et fabriqués en Grande-Bretagne par un des leaders mondiaux dans le domaine des roulements de précision
- Tolérance du calibre du rôle se situant entre 0,5 et 1,5 microns
- Un choix complet de tailles à partir de 25 mm d'alexage
- Qualité conforme aux normes ISO 9000
- Roulements en matériaux de haute qualité

Gamet Bearings

This single row bearing has an extended outer ring, housing a number of springs. It is mounted in conjunction with either a single or double row bearing. As the outer race is free to slide in the housing, the spring force ensures that a constant bearing system preload is maintained despite thermal expansion due to varying temperature conditions.

Dieses einreihige Lager hat einen verbreiterten Außenring, der eine Anzahl von Federn enthält. Es wird in Verbindung mit einem einreihigen oder zweireihigen Lager eingebaut.

Da der Außenring in seiner Führung im Gehäuse frei gleiten kann, ist durch die Federkraft eine gleichbleibende Vorspannung der Lagerung gewährleistet. Wärmedehnungen durch Temperaturschwankungen bleiben somit ohne Einfluss.

Ce roulement à simple rangée a une bague extérieure élargie comportant un certain nombre de ressorts.

Il est monté avec un roulement à simple rangée ou à double rangée.

Comme la bague extérieure est libre de glisser dans son logement, l'effort des ressorts assure une précharge permanente du roulement, malgré les dilatations dues aux conditions ambiantes de température.

BENEFITS

- Specialist design and manufacturing service available to meet your particular requirements
- Competitive delivery on most sizes

VORTEILE

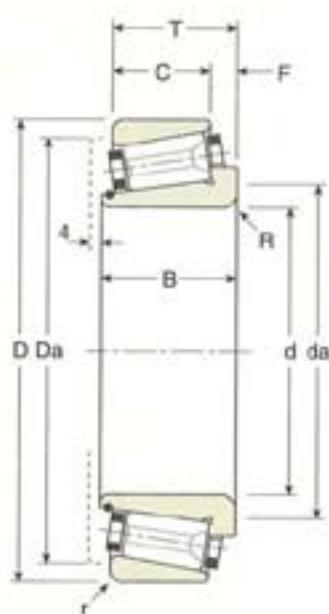

- Ihren besonderen Anforderungen entsprechend fachmännischer Konstruktions- und Fertigungsservice
- Konkurrenzfähige Lieferfristen für die meisten Größen

AVANTAGES

- Un service d'étude et de fabrication spécialisé à votre disposition pour répondre à vos besoins particuliers
- Livraisons devant la concurrence pour la plupart des tailles.

INTEGRAL SPRING CARRIER CUP (P TYPE)
MIT VORLASTFEDERN (TYPE P)
BAGUE EXTERIEURE COMPORTEANT DES RESSORTS DE RAPPEL (TYPE P)

da = Recommended shaft alignment diameter
empfohlener Durchmesser des Wellen-Widerlagers
diamètre recommandé d'alignement de l'arbre

L = 6 equally spaced holes (diameter)

6 Bohrungen am Umfang

6 trous équidistants

P = Load per spring (Max no. of springs 24)

Einzellast pro Feder (Max. 24 Vorlastfedern)

Charge par ressort en place (24 ressorts maxi)

S = Holes for springs

Federbohrungen

Logements des ressorts

T = Max permissible pre load

Max zulässige Vorlängung

Prädruck maxi possible

‡ = Static Stiffness Rad.

Statische Steifigkeit

Rigidité statique

***** = Basic Rating 10,000hrs@500 rpm

Belastung 10,000h@500U/min

Capacity 10,000lb@500tr/mm

Manufacturing Tolerances • Fertigungstoleranzen • Tolérances de fabrication

Bore d +0,005

INTEGRAL SPRING CARRIER CUP (P TYPE)
MIT VORLASTFEDERN (TYP P)
BAGUE EXTERIEURE COMPORTEANT DES RESSORTS DE RAPPEL (TYP P)

da - Recommended shaft abutment diameter
empfohlener Durchmesser des Wellen-Widerlagers
diamètre recommandé d'épaulement de l'arbre

L - 6 equally spaced holes (diameter)

6 Bohrungen am Umfang

6 trous équidistants

P - Load per string (Max no. of springs 24)

Einzellast pro Feder (Max 24 Vorlastfedern)

Charge par ressort en place (24 ressorts maxi)

§ - Holes for springs

Federbohrungen

Lagerlöcher für Federn

† - Max permissible pre load

Max zulässige Vorspannung

Précharge maxi possible

‡ - Static Stiffness Rad.

Statische Steifigkeit

Rigidité statique

*** - Basic Rating 10,000hrs@500rpm**

Belastung 10,000h@500U/min

Capacité 10,000h@500tr/min

Manufacturing Tolerances • Fertigungstoleranzen • Tolérances de fabrication

INTEGRAL SPRING CARRIER CUP (P TYPE)
MIT VORLASTFEDERN (TYPE P)
BAGUE EXTERIEURE COMPORTEANT DES RESSORTS DE RAPPEL (TYPE P)

da - Recommended shaft abutment diameter
empfohlener Durchmesser des Wellen-Widerlagens
diamètre recommandé d'épaisseur de l'arbre

L - 6 equally spaced holes (diameter)
6 Bohrungen am Umfang
6 trous équidistants

P - Lead per string (Max no. of springs 24)
Einzellast pro Feder (Max 24 Vorlastfedern)
Charge par ressort en place (24 ressorts maxi)

S - Holes for springs
Federbohrungen
Logements des ressorts

T - Max permissible pre load
Max zulässige Vorspannung
Poids charge maxi possible

† - Static Stiffness Rad.
Statische Steifigkeit
Rigidité statique

*** - Basic Rating 10,000hrs@500rpm**
Belastung 10.000h@500U/min
Capacité 10.000h@500U/min

INTEGRAL SPRING CARRIER CUP (P TYPE)
MIT VORLASTFEDERN (TYPE P)
BAGUE EXTERIEURE COMPORTEANT DES RESSORTS DE RAPPEL (TYPE P)

- da - Recommended shaft abutment diameter
empfohlener Durchmesser des Wellen-Widerlagen
diamètre recommandé d'épaulement de l'arbre
- L - 6 equally spaced holes (diameter)
6 Bohrungen am Umfang
6 trous équidistants
- P - Load per spring (Max no. of springs 24)
Einzellast pro Feder (Max 24 Vorlastfedern)
Charge par ressort en place (24 ressorts maxi)
- § - Holes for springs
Federbohrungen
Logements des ressorts
- † - Max permissible pre load
Max zulässige Vorspannung
Précharge maxi permise
- ‡ - Static Stiffness Rad.
Statische Steifigkeit
Rigidité statique
- * - Basic Rating 10,000hrs@500rpm
Belastung 10,000h@500U/min
Capacité 10,000h@500tr/min

PLAIN CUP (G TYPE)
AUSSENRING OHNE BUND (TYPE G)
BAGUE EXTERIEURE SANS COLLERETTE (TYPE G)

Gamet Bearings

Double row bearings offer nearly twice the capacity of the equivalent single row bearing, and are therefore used in more heavily loaded applications.

Zweireihige Lager haben in etwa die doppelte Kapazität des entsprechenden einreihigen Lagers. Sie werden deshalb bei starker belasteten Anwendungen eingesetzt.

Les roulements à double rangée offrent une capacité de charge presque deux fois supérieure à celle des roulements à simple rangée. En conséquence, ils sont utilisés pour les montages soumis à des efforts importants.

The plain outer race enables this bearing to be used in a 'floating' position to permit thermal expansion. As such it can replace a P type bearing when additional load capacity is required.

G type bearings can be preadjusted to give GE double row bearings. This is achieved by fitting a spacer between the inner races to give the required assembly end play or preload. The choice of setting is based upon a number of parameters such as speed, lubrication and applied loads. Spacer width is adjusted individually prior to despatch. For further advise contact Gamet Bearings.

Die ebene Außenfläche ermöglicht es, dieses Lager 'gleitend' einzubauen, um Wärmedehnung auszugleichen.

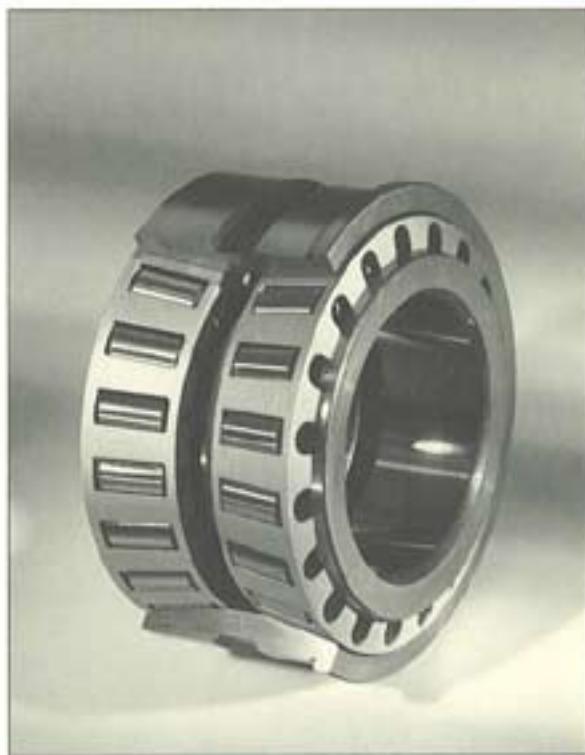

Somit kann es ein P-Lager ersetzen, falls zusätzliche Radialkräfte aufgenommen werden müssen.

G-Lager können als zweireihige Lager in Ausführung GE voreingestellt geliefert werden. Durch einen Distanzring - der zwischen die beiden Innenringe eingepasst wird - kann das Lager mit Vorspannung oder Spiel versehen werden. Die Wahl der Einstellung ist abhängig von verschiedenen Faktoren, wie Geschwindigkeit, der Schmierung und der Belastung usw. Die Breite des Distanzringes wird vor Auslieferung des Lagers individuell eingestellt, für weitere Beratung bitten wir Sie, sich an Gamet Bearings zu wenden.

La bague extérieure lisse permet d'utiliser ce roulement en position flottante, ce qui autorise la dilatation thermique. Tel quel, il peut être utilisé à la place d'un roulement de type P; quand une capacité de charge supérieure est nécessaire.

Les roulements de type G peuvent être prérglés pour obtenir des roulements à double rangée GE. Ceci est obtenu en placant une entretoise entre les bagues intérieures afin d'avoir dans le montage le jeu final ou la précharge requis. Le choix du préréglage dépend d'un certain nombre de paramètres tels que - vitesse, lubrification et charges appliquées. La largeur de l'entretoise est rectifiée individuellement, avant livraison.

Pour de plus amples informations, veuillez consulter Gamet Bearings.

Gamet Bearings

Double row bearings offer nearly twice the capacity of the equivalent single row bearing, and are therefore used in more heavily loaded applications.

Zweireihige Lager haben in etwa die doppelte Kapazität des entsprechenden einreihigen Lagers. Sie werden deshalb bei starker belasteten Anwendungen eingesetzt.

Les roulements à double rangée offrent une capacité de charge presque deux fois supérieure à celle des roulements à simple rangée. En conséquence, ils sont utilisés pour les montages soumis à des efforts importants.

This double row bearing has a flanged outer ring which locates the shaft axially. This can also simplify housing machining operations and overall design.

H type bearings can be preadjusted to give HE double row bearings. This is achieved by fitting a spacer between the inner races to give the required assembly end play or preload. The choice of setting is based upon a number of parameters such as speed, lubrication and applied loads. Spacer width is adjusted individually prior to despatch. For further advise contact Gamet Bearings.

Dieses zweireihige Lager hat einen Außerring mit Bund, der die Spindel axial fixiert. Somit kann die Bearbeitung des Gehäuses und der ganzen Baugruppe vereinfacht werden.

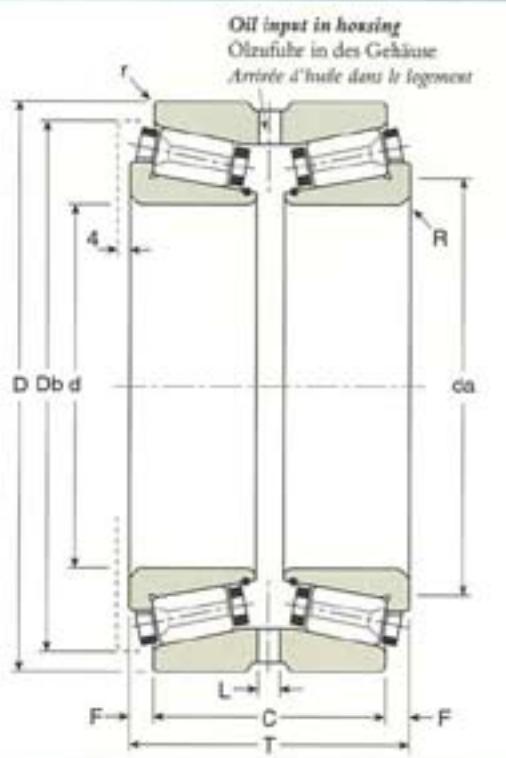

H-Lager können als zweireihige Lager in Ausführung HE vorgeingestellt geliefert werden. Durch einen Distanzring - der zwischen die beiden Innenringe eingepasst wird - kann das Lager mit Vorspannung oder Spiel versehen werden. Die Wahl der Einstellung ist abhängig von verschiedenen Faktoren, wie Geschwindigkeit, der Schmierung und der Belastung usw. Die Breite des Distanzringes wird vor Auslieferung des Lagers individuell eingestellt, für weitere Beratung bitten wir Sie, sich an Gamet Bearings zu wenden.

Ce roulement à double rangée a une bague extérieure avec collerette qui positionne l'arbre axialement. Cela permet également de simplifier les opérations d'usinage du logement et la conception d'ensemble.

Les roulements de type H peuvent être prérglés pour obtenir des roulements à double rangée HE. Ceci est obtenu en placant une entretoise entre les bagues intérieures afin d'avoir dans le montage le jeu final ou la précharge requis. Le choix du préréglage dépend d'un certain nombre de paramètres tels que - vitesse, lubrification et charges appliquées. La largeur de l'entretoise est rectifiée individuellement, avant livraison. Pour de plus amples informations, veuillez consulter Gamet Bearings.

| 55,000 | 96,838 | 65,00 | 54,000 | 5,5 | 70 |

Important note: For double row bearings the bore of the rear cone (marked 'B' track) is 0,002 to 0,004 mm larger than the 'A' track cone bore. This reduces the level of tight fit to facilitate adjustment of the bearing.

Wichtiger Hinweis: Bei zweireihigen Lagern ist die Bohrung des hinteren Innenringes (Markierung 'B'-Laufbahn) 0,002 bis 0,004mm grösser als die Bohrung des 'A'-Laufbahns. Dies erweitert den Sitz der Fassung und erleichtert das Einstellen des Lagers.

Note importante: Pour les roulements à double rangée, l'aisage du côté arrière (marqué 'B') est plus grand de 0,002 à 0,004mm que l'aisage du côté marqué 'A'. Ceci réduit le serrage de l'ajustement pour faciliter le montage du roulement.

PLAIN CUP (G TYPE)
AUSSENRING OHNE BUND (TYP G)
BAGUE EXTERIEURE SANS COLLERETTE (TYPE G)

- da - Recommended shaft abutment diameter
empfohlener Durchmesser des Wellen-Widerlagers
diamètre recommandé d'épaisseur de l'arbre
- L - 6 equally spaced holes (diameter)
6 Bohrungen am Umfang
6 trous équidistants
- db - Recommended housing abutment diameter
empfohlener Durchmesser des Gehäuse-Widerlagers
diamètre recommandé d'épaisseur de la boîte
- ‡ - Static Stiffness
Statische Steifigkeit
Rigidité statique
- * - Basic Rating 10,000h₀₀@500rpm
Belastung 10,000h@500U/min
Capacité 10,000h@500tr/min

| 77,788 | 120,650 | 64,000 | 49,700 | 7,15 | 90 |

Important note: For double row bearings the base of the rear cone (marked 'B' track) is 0,002 to 0,004 mm larger than the 'A' track one hole. This reduces the level of tight fit to facilitate adjustment of the bearing.

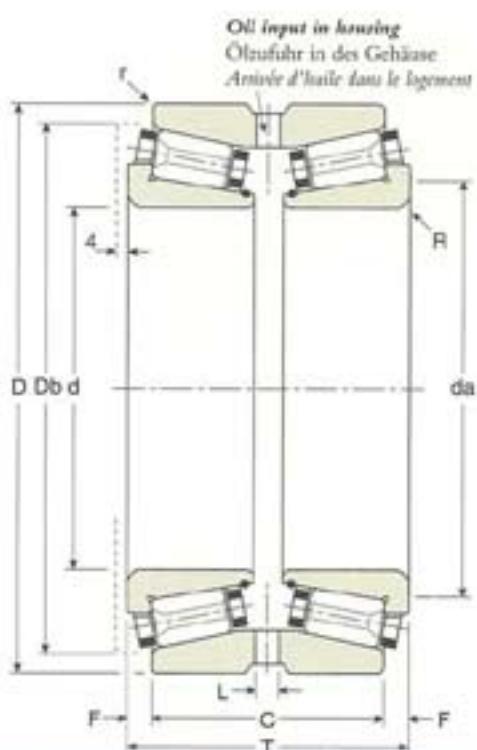

Wichtiger Hinweis: Bei zweireihigen Lagern ist die Basis des hinteren Kegels (Markierung 'B'-Laufbahn) 0,002 bis 0,004mm größer als die Basis des 'A'-Laufbahns. Dies erweitert den Sitz der Pausung und erleichtert das Einstellen des Lagers.

Note importante: Pour les roulements à double rangée, l'élargissement du disque arrière (marqué 'B') est plus grand de 0,002 à 0,004mm que l'élargissement du disque marqué 'A'. Ceci réduit le serrage de l'ajustement pour faciliter le montage du roulement.

**PLAIN CUP (G TYPE)

Important note: For double row bearings the bore of the rear cone (marked 'B' track) is 0,002 to 0,004 mm larger than the 'A' track cone bore. This reduces the level of tight fit to facilitate adjustment of the bearing.

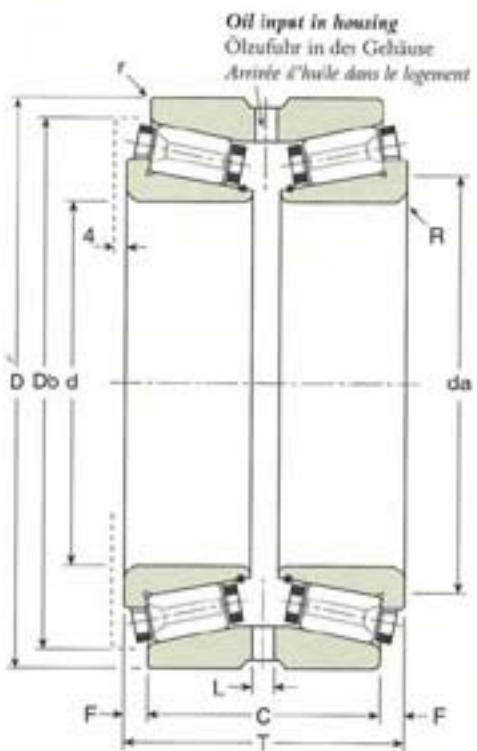

Wichtiger Hinweis: Bei zweireihigen Lagern ist die Bohrung des hinteren Innenringes (Markierung 'B'-Laufbahn) 0,002 bis 0,004 mm grösser als die Bohrung der 'A'-Laufbahn. Dies erweitert den Sitz der Passe und erleichtert das Einstellen des Lagers.

Note importante: Pour les roulements à double rangée, l'âme du cône arrière (marqué 'B') est plus grande de 0,002 à 0,004mm que l'âme du cône marqué 'A'. Ceci réduit le serrage de l'ajustement pour faciliter le montage du roulement.

Important note: For double row bearings the bore of the rear cone (marked 'B' track) is 0,002 to 0,004 mm larger than the 'A' track cone bore. This reduces the level of tight fit to facilitate adjustment of the bearing.

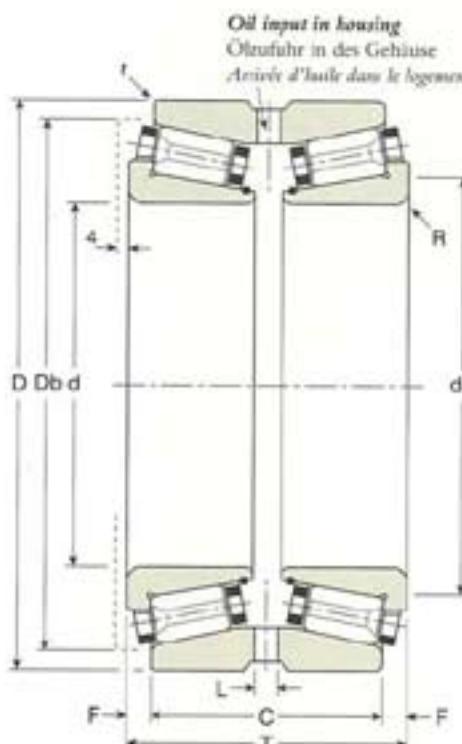

Wichtiger Hinweis: Bei zweireihigen Lagern ist die Bohrung des hinteren Innenringes (Markierung 'B'-Laufbahnen) 0,002 bis 0,004mm größer als die Bohrung der 'A'-Laufbahn. Dies erweitert den Sitz der Passung und erleichtert das Einstellen des Lagers.

Note importante: Pour les roulements à double rangée, l'alliage du côté arrêté (marqué 'B') est plus grand de 0,002 à 0,004mm que l'alliage du côté marqué 'A'. Ceci réduit le serrage de l'ajustement pour faciliter le montage du roulement.

| Diameter D | +0,005 0 | +0,010 0 |
| Width T | $\pm 0,500$ | $\pm 0,500$ |

Important note: For double row bearings the bore of the rear cone (marked 'B' track) is 0,002 to 0,004 mm larger than the 'A' track cone bore. This reduces the level of tight fit to facilitate adjustment of the bearing.

Wichtiger Hinweis: Bei zweireihigen Lagern ist die Bohrung des hinteren Innenrings (Markierung 'B'-Laufbahn') 0,002 bis 0,004mm größer als die Bohrung der 'A'-Laufbahn. Dies erweitert den Sitz der Fassung und erleichtert das Einstellen des Lagers.

| 55,000 | 98,425 | 65,00 | 54,00 | 22,50 | 5,50 | 10,00 | |

Important note: For double row bearings the bore of the rear zone (marked 'B' track) is 0,002 to 0,004 mm larger than the 'A' track zone bore. This reduces the level of tight fit to facilitate adjustment of the bearing.

Wichtiger Hinweis: Bei zweireihigen Lagern ist die Bohrung des hinteren Innenringes (Markierung 'B'-Laufbahn') 0,002 bis 0,004mm grösser als die Bohrung der 'A'-Laufbahn. Dies erweitert den Sitz der Passung und erleichtert das Einstellen des Lagers.

Note importante: Pour les roulements à double rangée, l'alésage du disque arrière (marqué 'B') est plus grand de 0,002 à 0,004mm que l'alésage du disque marqué 'A'. Ceci réduit le serrage de l'ajustement pour faciliter le montage du roulement.

Important note: For double row bearings the bore of the rear cone (marked 'B' track) is 0,002 to 0,004 mm larger than the 'A' track cone bore. This reduces the level of tight fit to facilitate adjustment of the bearing.

Wichtiger Hinweis: Bei zweireihigen Lagern ist die Bohrung des hinteren Innenringes (Markierung 'B'-Laufbahnr') 0,002 bis 0,004mm grösser als die Bohrung der 'A'-Laufbahn. Dies erweitert den Sitz der Passung und erleichtert das Einstellen des Lagers.

Note importante: Pour les roulements à double rangée, l'alliage du côté arrière (marqué 'B') est plus grand de 0,002 à 0,004mm que l'alliage du côté marqué 'A'. Ceci réduit le serrage de l'ajustement pour faciliter le montage du roulement.

Important note: For double row bearings the bore of the race cone (marked 'B' track) is 0,002 to 0,004 mm larger than the 'A' track cone bore. This reduces the level of tight fit to facilitate adjustment of the bearing.

Wichtiger Hinweis: Bei zweirädrigen Lagern ist die Bohrung des äußeren Innenringes (Markierung 'B-Laufbahn') 0,002 bis 0,004mm größer als die Bohrung der 'A'-Laufbahn. Dies erweitert den Sitz der Passung und erleichtert das Einstellen des Lager.

Note importante: Pour les roulements à double rangée, l'alésage du disque arrière (marqué 'B') est plus grand de 0,002 à 0,004mm que l'alésage du disque marqué 'A'. Ceci réduit le serrage de l'ajustement pour faciliter le montage du roulement.

Important note: For double row bearings the bore of the rear cone (marked 'B' track) is 0,002 to 0,004 mm larger than the 'A' track cone bore. This reduces the level of tight fit to facilitate adjustment of the bearing.

Wichtiger Hinweis: Bei zweireihigen Lagern ist die Bohrung des hinteren Kegelrollenringes (Markierung 'B-Lauffahrt') 0,002 bis 0,004mm größer als die Bohrung der 'A'-Lauffahrt. Dies erweitert den Sitz der Passung und erleichtert das Einstellen des Lagers.

Note importante: Pour les roulements à double rangée, l'aisage du côté arrière (marqué 'B') est plus grand de 0,002 à 0,004mm que l'aisage du côté marqué 'A'. Ceci évite le serrage de l'ajustement pour faciliter le montage du roulement.

Note importante: Pour les roulements à double rangée, l'alésage du côté arrière (marqué 'B') est plus grand de 0,002 à 0,004mm que l'alésage du côté marqué 'A'. Ceci réduit le serrage de l'ajustement pour faciliter le montage du roulement.
